In a case of "return to AutoCAD" development, the AutoLISP interpreter was adopted to bring back the original AutoLISP programming language by generating LISP code from AutoCAD's original drawing, thus allowing the user to program into the language from the original drawing. This allowed much more control over the program by the programmer. With AutoLISP, the programmer could customize the drawing process or even add new drawing tools. An example of this is the AutoCAD Architecture 2010 product. The Architecture 2010 product added a number of new drawing tools, such as wall tools, chamfer tools, and guide tools. In addition, the user could alter the entire drawing or any part of it by using the AutoLISP interface. Integration The AutoCAD platform is tied to Microsoft Windows, and so it is designed to run only on that operating system. AutoCAD can be integrated with other applications using OLE, including Office 2000 or later, Visual Studio, Delphi and Access. OLE is an open architecture system for Microsoft Windows that enables programs to integrate with each other by using only a common set of Application Programming Interface (API) functions. The conventional coffee making process consists of a number of steps including the roasting of the beans, grinding of the beans, mixing of ground coffee with a water soluble solvent, filtration of the mixture, and the addition of a diluent. The resulting brew is then filtered and the solvent is recovered. The solvents, the water, and the filtrate are then disposed of. In the conventional process, a number of different units must be used, with each having a number of moving parts, in order to fully and properly carry out the process. This necessarily results in a lengthy, labor intensive process that generally requires a minimum of eight hours to properly prepare a pot of coffee. Furthermore, the equipment employed to produce the coffee is bulky and
