Autism spectrum disorder (ASD) is characterized by a pervasive pattern of deficits in social communication and restrictive,

---

repetitive behaviors. Genome-wide linkage analysis showed a linkage peak on chromosome 7q in the family with an autistic child. One of the genes in this region encodes solute carrier family 6 (neurotransmitter transporter, serotonin), member 4 (SLC6A4), and patients with the 7q11.23 deletion syndrome had a broad spectrum of autistic behaviors. We performed targeted sequence analysis of the coding region of SLC6A4 in a Japanese family with a child with ASD, in which a full deletion of SLC6A4 was identified in an autistic boy. The present study supports that

---

SLC6A4 may play a role in ASD and that a deletion of the SLC6A4 gene causes the phenotypic expression of ASD.---
